

# CSE-301

# Combinatorial Optimization

---

Asymptotic Notation

# Analyzing Algorithms

---

- Predict the amount of resources required:
  - **memory**: how much space is needed?
  - **computational time**: how fast the algorithm runs?
- FACT: running time grows with the size of the input
- Input size (number of elements in the input)
  - Size of an array, polynomial degree, # of elements in a matrix, # of bits in the binary representation of the input, vertices and edges in a graph

*Def: Running time = the number of primitive operations (steps) executed before termination*

- Arithmetic operations (+, -, \*), data movement, control, decision making (*if*, *while*), comparison

# Algorithm Analysis: Example

---

- *Alg.:* MIN ( $a[1], \dots, a[n]$ )

$m \leftarrow a[1];$

for  $i \leftarrow 2$  to  $n$

if  $a[i] < m$

then  $m \leftarrow a[i];$

- **Running time:**

- the number of primitive operations (steps) executed before termination

$$T(n) = 1 [\text{first step}] + (n) [\text{for loop}] + (n-1) [\text{if condition}] + (n-1) [\text{the assignment in then}] = 3n - 1$$

- **Order (rate) of growth:**

- The leading term of the formula
- Expresses the asymptotic behavior of the algorithm

# Typical Running Time Functions

---

- 1 (constant running time):
  - Instructions are executed once or a few times
- $\log N$  (logarithmic)
  - A big problem is solved by cutting the original problem in smaller sizes, by a constant fraction at each step
- $N$  (linear)
  - A small amount of processing is done on each input element
- $N \log N$ 
  - A problem is solved by dividing it into smaller problems, solving them independently and combining the solution

# Typical Running Time Functions

---

- $N^2$  (quadratic)
  - Typical for algorithms that process all pairs of data items (double nested loops)
- $N^3$  (cubic)
  - Processing of triples of data (triple nested loops)
- $N^k$  (polynomial)
- $2^N$  (exponential)
  - Few exponential algorithms are appropriate for practical use

# Growth of Functions

---

<b>n</b>	<b>1</b>	<b>lgn</b>	<b>n</b>	<b>n lgn</b>	<b>n<sup>2</sup></b>	<b>n<sup>3</sup></b>	<b>2<sup>n</sup></b>
<b>1</b>	1	0.00	1	0	1	1	2
<b>10</b>	1	3.32	10	33	100	1,000	1024
<b>100</b>	1	6.64	100	664	10,000	1,000,000	$1.2 \times 10^{30}$
<b>1000</b>	1	9.97	1000	9970	1,000,000	$10^9$	$1.1 \times 10^{301}$

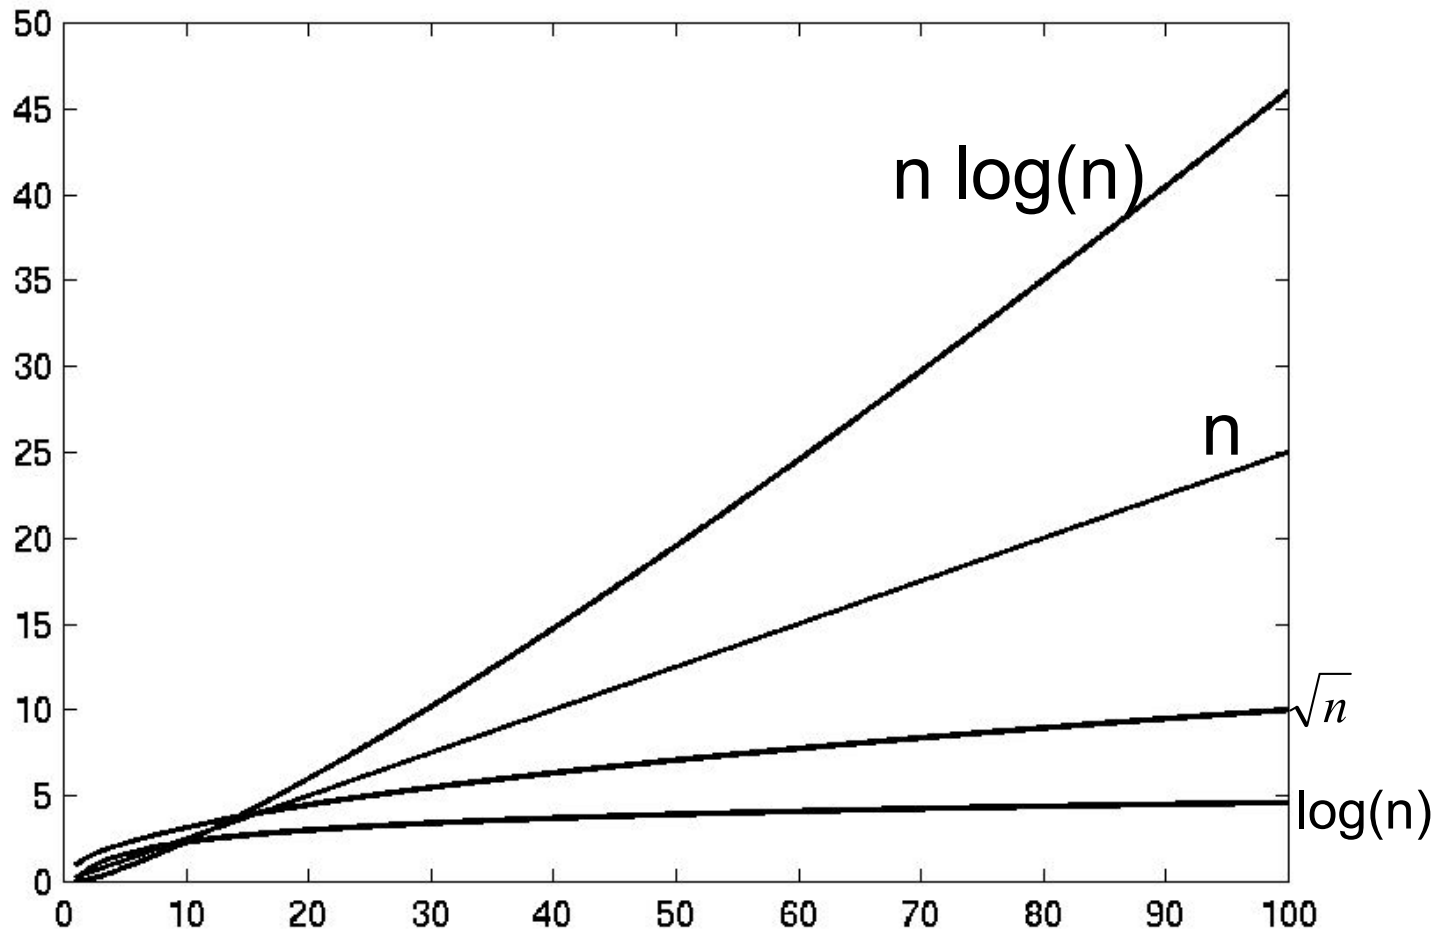

# Complexity Graphs

---

# Complexity Graphs

---

# Complexity Graphs

---

# Complexity Graphs (log scale)

# Algorithm Complexity

---

- **Worst Case Complexity:**
  - the function defined by the *maximum* number of steps taken on any instance of size  $n$
- **Best Case Complexity:**
  - the function defined by the *minimum* number of steps taken on any instance of size  $n$
- **Average Case Complexity:**
  - the function defined by the *average* number of steps taken on any instance of size  $n$

# Best, Worst, and Average Case Complexity

---

# Doing the Analysis

---

- It's hard to estimate the running time exactly
  - Best case depends on the input
  - Average case is difficult to compute
  - So we usually focus on worst case analysis
    - Easier to compute
    - Usually close to the actual running time
- Strategy: find a function (an equation) that, for large  $n$ , is an upper bound to the actual function (actual number of steps, memory usage, etc.)

# Motivation for Asymptotic Analysis

---

- *An exact computation of worst-case running time can be difficult*
  - Function may have many terms:
    - $4n^2 - 3n \log n + 17.5n - 43n^{2/3} + 75$
- *An exact computation of worst-case running time is unnecessary*
  - Remember that we are already approximating running time by using RAM model

# Classifying functions by their Asymptotic Growth Rates (1/2)

---

- asymptotic growth rate, asymptotic order, or order of functions
  - Comparing and classifying functions that ignores
    - *constant factors* and
    - *small inputs*.
- The Sets big oh  $O(g)$ , big theta  $\Theta(g)$ , big omega  $\Omega(g)$

# Classifying functions by their Asymptotic Growth Rates (2/2)

---

- $O(g(n))$ , Big-Oh of  $g$  of  $n$ , the Asymptotic Upper Bound;
- $\Theta(g(n))$ , Theta of  $g$  of  $n$ , the Asymptotic Tight Bound; and
- $\Omega(g(n))$ , Omega of  $g$  of  $n$ , the Asymptotic Lower Bound.

# Big-O

---

$f(n) = O(g(n))$ : there exist positive constants  $c$  and  $n_0$  such that  $0 \leq f(n) \leq cg(n)$  for all  $n \geq n_0$

---

- What does it mean?

- If  $f(n) = O(n^2)$ , then:

- $f(n)$  can be larger than  $n^2$  sometimes, **but...**
    - We can choose some constant  $c$  and some value  $n_0$  such that for **every** value of  $n$  larger than  $n_0$  :  $f(n) < cn^2$
    - That is, for values larger than  $n_0$ ,  $f(n)$  is never more than a constant multiplier greater than  $n^2$
    - Or, in other words,  $f(n)$  does not grow more than a constant factor faster than  $n^2$ .

# Visualization of $O(g(n))$

# Examples

---

-  $2n^2 = O(n^3)$ :

$$2n^2 \leq cn^3 \Rightarrow 2 \leq cn \Rightarrow c = 1 \text{ and } n_0 =$$

-  $n^2 = O(n^2)$ :

$$n^2 \leq cn^2 \Rightarrow c \geq 1 \Rightarrow c = 1 \text{ and } n_0 =$$

-  $1000n^2 + 1000n = O(n^2)$ :

$$1000n^2 + 1000n \leq cn^2 \leq cn^2 + 1000n \Rightarrow c = 1001 \text{ and } n_0 =$$

1

-  $n = O(n^2)$ :

$$n \leq cn^2 \Rightarrow cn \geq 1 \Rightarrow c = 1 \text{ and } n_0 =$$

1

# Big-O

---

$$2n^2 = O(n^2)$$

$$1,000,000n^2 + 150,000 = O(n^2)$$

$$5n^2 + 7n + 20 = O(n^2)$$

$$2n^3 + 2 \neq O(n^2)$$

$$n^{2.1} \neq O(n^2)$$

# More Big-O

---

- Prove that:  $20n^2 + 2n + 5 = O(n^2)$
- Let  $c = 21$  and  $n_0 = 4$
- $21n^2 > 20n^2 + 2n + 5$  for all  $n > 4$   
 $n^2 > 2n + 5$  for all  $n > 4$

TRUE

# Tight bounds

---

- We generally want the tightest bound we can find.
- While it is true that  $n^2 + 7n$  is in  $O(n^3)$ , it is more interesting to say that it is in  $O(n^2)$

# Big Omega – Notation

---

∀  $\Omega()$  – A **lower** bound

$f(n) = \Omega(g(n))$ : there exist positive constants  $c$  and  $n_0$  such that  
 $0 \leq f(n) \geq cg(n)$  for all  $n \geq n_0$

- $n^2 = \Omega(n)$
- Let  $c = 1$ ,  $n_0 = 2$
- For all  $n \geq 2$ ,  $n^2 > 1 \times n$

# Visualization of $\Omega(g(n))$

# $\Theta$ -notation

---

- Big-O is not a tight upper bound. In other words  $n \neq O(n^2)$

$\forall$   $\Theta$  provides a tight bound

$f(n) = \Theta(g(n))$ : there exist positive constants  $c_1, c_2$ , and  $n_0$  such that  
$$0 \leq c_1 g(n) \leq f(n) \leq c_2 g(n) \text{ for all } n \geq n_0$$

- In other words,

$$f(n) = \Theta(g(n)) \Rightarrow f(n) = O(g(n)) \text{ AND } f(n) = \Omega(g(n))$$

# Visualization of $\Theta(g(n))$

# A Few More Examples

---

- $n = O(n^2) \neq \Theta(n^2)$
- $200n^2 = O(n^2) = \Theta(n^2)$
- $n^{2.5} \neq O(n^2) \neq \Theta(n^2)$

## Example 2

---

- Prove that:  $20n^3 + 7n + 1000 = \Theta(n^3)$
- Let  $c = 21$  and  $n_0 = 10$
- $21n^3 > 20n^3 + 7n + 1000$  for all  $n > 10$   
 $n^3 > 7n + 5$  for all  $n > 10$

TRUE, but we also need...

- Let  $c = 20$  and  $n_0 = 1$
- $20n^3 < 20n^3 + 7n + 1000$  for all  $n \geq 1$

TRUE

# Example 3

---

- Show that  $2^n + n^2 = O(2^n)$
- Let  $c = 2$  and  $n_0 = 5$

$$2 \times 2^n > 2^n + n^2$$

$$2^{n+1} > 2^n + n^2$$

$$2^{n+1} - 2^n > n^2$$

$$2^n(2-1) > n^2$$

$$2^n > n^2 \quad \forall n \geq 5 \quad \checkmark$$

# Asymptotic Notations - Examples

---

## ∇ Θ notation

- $n^2/2 - n/2 = \Theta$
- $(6n^3 + 1)\lg n / (n^2 + 1) = \Theta$
- $n$  vs.  $n^2$        $n \neq \Theta(n^2 \lg n)$

## ∇ Ω notation

- $n^3$  vs.  $n^2$        $n^3 = \Omega(n^2)$
- $n$  vs.  $\log n$        $n = \Omega(\log n)$
- $n$  vs.  $n^2$        $n \neq \Omega(n^2)$

## • O notation

- $2n^2$  vs.  $n^3$        $2n^2 = O(n^3)$
- $n^2$  vs.  $n^2$        $n^2 = O(n^2)$
- $n^3$  vs.  $n \log n$        $n^3 \neq O(n \log n)$

# Asymptotic Notations - Examples

---

- For each of the following pairs of functions, either  $f(n)$  is  $O(g(n))$ ,  $f(n)$  is  $\Omega(g(n))$ , or  $f(n) = \Theta(g(n))$ . Determine which relationship is correct.

- $f(n) = \log n^2$ ; $g(n) = \log n + 5$	$f(n) = \Theta(g(n))$
---	-----------------------

- $f(n) = n$ ; $g(n) = \log n^2$	$f(n) = \Omega(g(n))$
----------------------------------	-----------------------

- $f(n) = \log \log n$ ; $g(n) = \log n$	$f(n) = O(g(n))$
--	------------------

- $f(n) = n$ ; $g(n) = \log^2 n$	$f(n) = \Omega(g(n))$
----------------------------------	-----------------------

- $f(n) = n \log n + n$ ; $g(n) = \log n$	$f(n) = \Omega(g(n))$
---	-----------------------

- $f(n) = 10$ ; $g(n) = \log 10$	$f(n) = \Theta(g(n))$
----------------------------------	-----------------------

- $f(n) = 2^n$ ; $g(n) = 10n^2$	$f(n) = \Omega(g(n))$
---------------------------------	-----------------------

- $f(n) = 2^n$ ; $g(n) = 3^n$	$f(n) = O(g(n))$
-------------------------------	------------------

# Simplifying Assumptions

---

- 1. If  $f(n) = O(g(n))$  and  $g(n) = O(h(n))$ , then  $f(n) = O(h(n))$
- 2. If  $f(n) = O(kg(n))$  for any  $k > 0$ , then  $f(n) = O(g(n))$
- 3. If  $f_1(n) = O(g_1(n))$  and  $f_2(n) = O(g_2(n))$ ,
  - then  $f_1(n) + f_2(n) = O(\max(g_1(n), g_2(n)))$
- 4. If  $f_1(n) = O(g_1(n))$  and  $f_2(n) = O(g_2(n))$ ,
  - then  $f_1(n) * f_2(n) = O(g_1(n) * g_2(n))$

# Example

---

- Code:
- `a = b;`
- Complexity:

# Example

---

- Code:
  - `sum = 0;`
  - `for (i=1; i <=n; i++)`
  - `sum += n;`
- Complexity:

# Example

---

- **Code:**
- `sum = 0;`
- `for (j=1; j<=n; j++)`
- `for (i=1; i<=j; i++)`
- `sum++;`
- `for (k=0; k<n; k++)`
- `A[k] = k;`
- **Complexity:**

# Example

---

- Code:
- `sum1 = 0;`
- `for (i=1; i<=n; i++)`
- `for (j=1; j<=n; j++)`
- `sum1++;`
- Complexity:

# Example

---

- Code:
- `sum2 = 0;`
- `for (i=1; i<=n; i++)`
- `for (j=1; j<=i; j++)`
- `sum2++;`
- Complexity:

# Example

---

- Code:
- `sum1 = 0;`
- `for (k=1; k<=n; k*=2)`
- `for (j=1; j<=n; j++)`
- `sum1++;`
- Complexity:

# Example

---

- Code:
- `sum2 = 0;`
- `for (k=1; k<=n; k*=2)`
- `for (j=1; j<=k; j++)`
- `sum2++;`
- Complexity:

# Recurrences

---

*Def.: Recurrence = an equation or inequality that describes a function in terms of its value on smaller inputs, and one or more base cases*

- E.g.:  $T(n) = T(n-1) + n$
- Useful for analyzing recurrent algorithms
- Methods for solving recurrences
  - Substitution method
  - Recursion tree method
  - Master method
  - Iteration method
